

How to bulk upload drivers

Use this when onboarding many drivers from Excel. Open Admin, go to Drivers, then Bulk import. You need the `drivers.manage` permission.

What you need before you start

- Restaurants already created in Admin, with an RST code, and published + active if the driver must be assigned now.
- Each driver: full name, Kuwait phone, 12-digit civil ID, 4-8 digit employee ID, at least one restaurant.
- Optional: partner, zone, vehicle / bike ID, nationality, rider category (in_house or outsourced).

Step-by-step

1. Drivers > Bulk import.
2. Download sample template. The workbook has a Drivers sheet plus Restaurants, Zones, and Partners sheets filled from live data.
3. Or click Download all IDs (or Restaurants / Zones / Partners) to export current lists. Restaurant rows include name, RST code, ID, partner, and zone.
4. Fill the Drivers sheet. Paste RST code into Restaurants. To also assign partner and zone, copy those values from the same restaurant row.
5. Save as .xlsx, .xls, or .csv. Drop the file on the dashed area, or click to browse.
6. Map columns. Required fields are marked *. Preview stays disabled until every required field is mapped.
7. Check Preview. Only Ready rows import. Fix Unknown / Ambiguous / Missing / Duplicate rows, or download errors after import.
8. Choose Skip or Update intake for phones that already exist. Turn on Approve immediately only if you want passcodes minted now.
9. Import. If you approved immediately, download the credentials file (employee ID, driver code, passcode) and give it to ops/drivers.

How restaurant / zone / partner mapping works

Paste RST code (best), unique restaurant name, or UUID. Several restaurants: RST-0001, RST-0002. Partner and zone accept name, code (zone), or UUID. If two records share the same name, use the code or ID from the export instead of the name.

Spreadsheet columns

Column	Required	What to enter
Full Name	Yes	Driver display name
Phone (+965)	Yes	8 local digits, or +965 / 965 plus those 8. Example: 99123456 or +96599123456
Civil ID	Yes	Exactly 12 digits
Employee ID	Yes	4 to 8 digits, unique
Restaurant IDs	Yes	RST code, unique name, or UUID. Comma-separated for more than one
Partner	No	Partner name or UUID from the Partners / restaurant export
Zone	No	Zone name, code, or UUID from the Zones / restaurant export
Vehicle	No	Bike ID or plate already in Admin

Nationality	No	ISO code or country name, e.g. IN or India
Rider Category	No	in_house or outsourced. Blank becomes in_house

Restaurant export columns (paste helpers)

Column	Use
RST code (paste this)	Put in the Restaurants column. Preferred.
ID	Use if names clash
Partner (paste this) / Partner ID	Optional Partner column
Zone (paste this) / Zone code / Zone ID	Optional Zone column
Importable	Yes = published and active. Only those can be assigned on import

Preview statuses

Status	Meaning	What to do
Ready	Row can import	Leave it
Missing fields	Required cell empty	Fill name, phone, civil ID, employee ID, restaurant
Invalid phone / civil ID / employee ID	Wrong length or format	Fix the cell
Unknown restaurant / partner / zone / vehicle	No match in Admin	Use the export; check published + active
Name matches more than one	Ambiguous name	Paste RST code, zone code, or UUID
Duplicate phone / civil ID / employee ID	Already in this file or in the system	Skip, or Update intake for an existing phone

After import

- Without Approve immediately: drivers land as intakes. Approve each one later from the driver page to mint a passcode.
- With Approve immediately: download credentials XLSX and store it securely. Passcodes are shown only in that file.
- Download errors XLSX to correct failed rows and import again.

Do not

Do not invent RST codes. Do not put two different drivers on the same employee ID or phone. Do not approve immediately unless you will collect the credentials file in the same session.

Short example

Download Restaurants. Find Crystal Tower, RST-0001, partner Talabat, zone HAW. On the Drivers sheet enter: Ahmed Ali | +96599123456 | 281010100001 | 12345 | RST-0001 | Talabat | HAW. Upload, map required columns, Preview Ready, Import.
